

BrainWorks App

The BrainWorks app provides structure to a child's sensory break by allowing him/her to select activities appropriate for their current setting (Home, School, Community, Desk) and sensory system needs (Just Right, Slow & Sluggish, Fast & Stressed, or Fast & Hyper). The adult is able to adjust the length of the sensory break and the activity options available to the child.

Recommended Usage

Children with sensory processing disorder, Autism Spectrum Disorder, ADHD and other diagnoses often benefit from sensory strategies that allow them to handle the sensory input from their environment more effectively. The BrainWorks App makes the selection of appropriate activities fun and easy.

When the parent or teacher recognizes that the child needs some sensory input, he or she can open the app, select the child, choose whether or not to use a timer, and then hand the device to the child who would be guided as needed to choose appropriately when asked "How is your Sensory System?"

The child then will see a list of appropriate activities based on the current state of their sensory system and their current location. If the timer is being used, a red bar will appear at the top to indicate how much time remains. The child can select one activity, engage in that activity and then tap "Activities" to go back to the list to make another selection, and so on, until the timer runs out.

Features

- **Fully customizable**
- **Recommended for children between the ages of 3 and 12**
- **Pre-loaded with over 150 sensory activities**
- **Allows custom activities to be easily added at any time**
- **Available for iOS devices – iPhones, iPods, iPads through iTunes**
- **\$11.99 Full Price, Educational Facilities are eligible for 50% off through iTunes account**
- **Includes research-based sensory activities**
- **Languages available: English, Spanish, Dutch**
